LEOI-18 Fabry-Perot Interferometer

Description

The Fabry-Perot interferometer (LEOI-18) is a standalone device that can be used to observe multiple-beam interference fringes and measure the wavelength separation of Sodium D-lines. When equipped with other components, this device can be used to conduct other experiments such as to observe the spectral shift of a Mercury isotope or the splitting of spectral lines of atoms in a magnetic field (the Zeeman effect).

Feathure

Including Sodium Lamp with Power Supply
Smooth Mirror Movement
Ideal for Demonstration
Compact Design
Two Micrometers

Specification

Flatness of Reflective Mirrors	λ/20
Diameter of Reflective Mirrors	30 mm
Reflectance of Mirrors	95%
Effective Travel of Preset Micrometer	~ 3 mm
Min Division Value of Preset Micrometer	0.01 mm
Travel of Fine Adjustment of Movable Mirror	1.25 mm
Resolution of Fine Adjustment	0.0005 mm
Low-Pressure Sodium Lamp	20 W

Part list

Description	Qty
Fabry-Perot Interferometer	1
Observation Lens	1
Lens Holder (LEPO-9)	1
Mini Microscope	1
Microscope Holder	1
Ground Glass Screen (LEPO-45)	1
Low-Pressure Sodium Lamp (LLE-2)	1
Sodium Lamp Power Supply	1
User's Manual	1
